# Mobility

## Mobility

- is defined as
  - the possibility or ability of movement,
  - the concrete act of moving (traffic).
- can be
  - of spatial, social, or intellectual kind,
  - the behaviour of individuals,
  - altered by innovations and adaptions to everyday life.

# **Virtual Mobility**

## **Virtual Mobility**

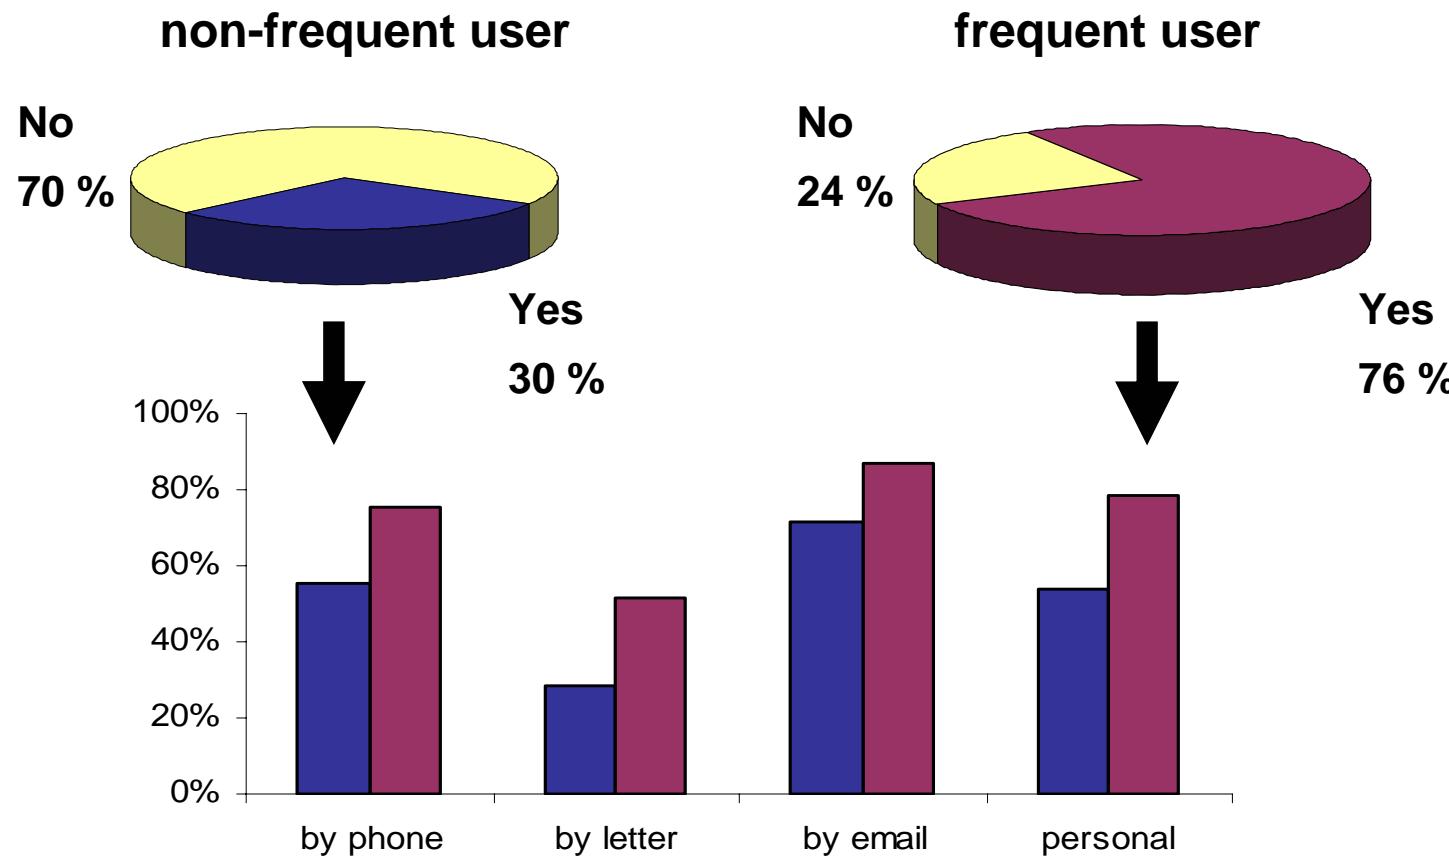

- Parallel Development of communication (media) and mobility: Overcoming of space and time for the purpose of taking part in social processes and activities.

## **Hypothesis of the complementarity of virtual and physical mobility:**

- New ICTs open up new virtual areas of mobility, new real areas of mobility (Medical Support...) and lead to real structural changes (Services, traffic regulation...).
- Persons with high physical mobility tend complementary to a higher usage of ICTs.

# From virtual communication to face-to-face-communication

# Mobility Effects of Selected Online Services

## Conclusions

- Virtual mobility creates new communication sites, which induce a functional usage of offers,
- the Internet is a in/direct means for increasing the potential of mobility of the society,
- within sub-groups special ways of usage can be observed which have traffic relevant impacts.

# **Mobility Effects of Selected Online Services, also mobile phone-based**

## Perspective

- Physical presence sometimes is secondary as long as the purpose of activity is achieved,
- individual decision considerations will determine alternatives of physical and virtual mobility,
- due to adaptive usage new virtual patterns of behaviour appear,
- but this process gradually intensifies supplementary media (phone, letters) and leads to personal encounter, finally.
